Life on other planets?

Do you have any evidence to support the hypothesis that life exists on planets other than Earth? There is a vast amount of literature that supports this hypothesis. I have looked at this issue from a Sociological perspective since creating the term "Exosociology" in 1974.

Life on other planets exists as a "Social Fact" even if it does not exist as a biological fact. If we ever discover life forms in a biological sense, the implications will be largely sociological for our planet.
